Abstract:

During this review period, we continued the development of the Brozer privacy layer and focused on improving the sensitive-content detection and redaction workflow. The tiered detection pipeline was further developed to identify structured sensitive information using pattern-based detection and contextual information using semantic detection. We also refined the DOM-to-pixel geometry mapping to accurately locate sensitive elements within screenshots and continued handling fractional device pixel ratios. The redaction workflow was improved to ensure that detected sensitive regions are protected locally before the screenshot is passed to the reasoning backend. The privacy egress gate and log sanitizer were also strengthened to maintain a controlled transport path and prevent sensitive information from being exposed through outgoing frames or system logs.

Progress for [24.10.2026]

- Refine sensitive-content detection and redaction accuracy.
- Test DOM-to-pixel mapping across browser layouts and device pixel ratios.
- Strengthen the privacy egress gate and log sanitizer.
- Integrate the browser extension, reasoning server, and local execution companion.
