Abstract:

During this review period, we completed the integration of the Brozer privacy boundary layer with the browser extension, reasoning backend, and local execution companion. The tiered detection pipeline was evaluated to verify detection accuracy for structured sensitive entities and contextual information across dynamic webpages. We validated the DOM-to-pixel geometry mapping to locate sensitive elements reliably across responsive browser layouts and fractional device pixel ratios. The redaction engine successfully enforces local masking to ensure that protected regions never reach the reasoning server. In addition, the privacy egress gate and log sanitizer were comprehensively tested to confirm that outgoing communication payloads and system logs remain free of unredacted sensitive values.

Progress for [31.10.2026]

- Benchmark end-to-end task execution latency across multi-step browser workflows.
- Validate policy check enforcement and local autofill action-gating mechanisms.
- Measure redaction precision and recall across diverse web forms and authenticated dashboards.
- Finalize system performance documentation and prepare comprehensive review deliverables.
